Today, there is a practical and viable alternative to the traditional way of controlling domestic and commercial lighting.

## Economy and flexibility

Achieving the control of lighting where there is more than one control switch, particularly where they are located some distance from one another, has always been complicated and costly. A second control switch requires 3 additional wires, whilst every intermediate switching location requires no less than 4 wires. In such cases, utilising an impulse (or step) relay has many advantages; designing the system is simpler - it is more easily expanded - installation costs are noticeably reduced.

## Simplicity

Using 2-wire pushbuttons to control the coil of a centrally located impulse relay, which in turn controls the lights, greatly simplifies the wiring normally associated with one-way, two-way and intermediate switches. The 2 -wire coil "command circuit" is easily extended to as many lighting control locations as needed, and can use smaller and neater conductors ( $0.5 \mathrm{~mm}^{2}$ - CEI 64-8), since they need only to carry the load of the relay coil (typically $20 \div 600 \mathrm{~mA}$ ).
The power circuit to the lights should of course be of sufficient capacity, but instead of following the usual
route of a traditional system to all the switches, it needs to run only to the impulse relay and then to the lights.

## Safety

Where necessary, and particularly for safety reasons, a transformer can be used to power the command circuit at a voltage lower than the supply voltage - impulse relay coils being available in several AC or DC voltages. No other component offers this enhanced safety through separating the command from the power circuit, nor the savings derived from added versatility and simplification of the system.

## Versatility

In addition to the technical advantages already described, a number of versatile mounting modes for the relay are possible; ranging from a normal junction box, screw fixing, and 35 mm rail (EN 60715) mounting systems.

## Introduction to relay controlled lighting systems

## Conforming to International Standards

In Europe, EU Directive 46/90 and successive amendments state that, as well as using recognised technicians to carryout the installation, the materials and components used in the system should adhere to International and National standards. It is particularly important that this can be verified with Declarations of Conformity citing the appropriate standards, and certification documents from the appropriate National certification organisation.

FINDER impulse relays are designed and constructed in compliance to CEI regulations and, depending on type, have been officially certified by the appropriate standards authorities with respect to performance and quality, being subject to both Type Testing and ongoing periodic QC testing. (Refer to page 13 of this Guide)

## APPROPRIATE STANDARDS

EN 61810-1:
Electromechanical Elementary Relays - Part 1:
General and safety requirements
EN 60669-1:
Switches for household and similar fixed electrical installations. General requirements
64-8: Electrical Systems.

## Noise level

FINDER is engaged in continual research into the reduction of the acoustic noise generated by the mechanical action of operating the contacts.

Improved with respect to earlier versions of impulse relay, the current 20,26 Series and 27 series create no more noise than a normal switch (about 20 dB ), whilst the SILENT IMPULSE RELAY "13.81" and "13.91" generates no noise noticeable above the general background noise where it is installed.

## The Switching Function code

The Switching Function fundamentally defines the particular sequence in which the step relay contacts open and close, and the number of "steps" before this sequence repeats itself. The digit in the fourth position of the Finder part number denotes the Switching Function.

| Relay type | Number of Steps | Switching Sequence |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 1 | 2 | 3 | 4 |
| xx.x1 | 2 | 1 | 4 |  |  |
| xx.x2 | 2 | $1^{1} 1^{1}$ | 44 |  |  |
| xx.x3 | 2 | 14 | $4{ }^{1}$ |  |  |
| xx.x4 | 4 | $\left.1^{1}\right)^{\prime}$ | 44 | $1 / 1$ | $4{ }^{\prime}$ |
| xx.x5 | 4 | $\nu^{\prime}{ }^{1}$ | $1^{1}$ | 4 | 44 |
| xx.x6 | 3 | $1^{1} 1^{1}$ |  | 44 |  |
| xx.x8 | 4 | $1^{1} 1^{1}$ | $4{ }^{1}$ | $1^{1} 1^{\prime}$ | $1!$ |

## Comparison between relay system and tradifional system

Relay System Wiring - Single Zone On/Off control
Using single relay (Function code " 1 ") and simple wiring Possible relay types, 20.21-26.01-27.01-27.21-13.81-13.91

Comparing both systems, even for the simplest uses, the relay system offers advantages.
Only two wires are required for the "command circuit", and they can be of a smaller cross section ( 0.5 mm ). Whereas, in a traditional system the conductors have to be
sized to take the load current and are far more numerous. From an economic viewpoint, not only are there savings in material costs, but also less time is taken by the electrician to install the relay system. This system is also much easier to modify or extend.

## Comparison between relay system and traditional system

Traditional System Wiring - Single Zone On/Off control
Using multi-pole switches and multiple wiring

## Comparison between relay system and tradifional system

Wiring Schematic - Relay system
Single Zone On/Off control - Function code "1" (1 pole 2 step sequence) relay

Example shows relay type 27.01.

## Comparison between relay system and traditional system

Wiring Schematic - Traditional system
Single Zone On/Off switching - Multi-pole switches and wiring

## Comparison between relay system and traditional system

Relay System Wiring - 2 Lighting Zones, 3 sequence On/Off control
Using single relay (Function code " 6 ") and simple wiring
Possible relay types, 20.26-26.06-27.06-27.26

For more complex functions such as the one above, the relay system is self evidently simpler and more economical to install. Savings of typically $40 \%$ can be achieved. The function of this particular application is to offer 3-step
sequence control over two circuits, or lighting "zones", using a single impulse relay with 2 independent contacts. Successive operation of any of the push buttons sequences the lighting through all three permutations.

## Comparison between relay system and traditional system

Traditional System Wiring - 2 Lighting Zones
Using mullii-pole switches and complex wiring

## Comparison between relay system and traditional system

Wiring Schematic - Relay system
2 Zone On/Off switching - Function code "6" (2 pole 3 step sequence) relay

Example shows relay type 27.06 .

## 10 Series - Light dependent relay

## Advantage of the "light feedback compensation" principle

Light dependent relay where the lighting being controlled does not influence the light level seen by the sensor

Traditional light dependent relay where the lighting being controlled influences the light level seen by the sensor

Type 10.32, 10.41 and 10.51 light dependent relay with "light feedback compensation"

recalculated OFF threshold

The innovative principle of "light feedback compensation" avoids the annoying and damaging effects of the lamps repeatedly "hunting" between On and Off, due to poor installation

Ambient light level as measured by the light dependent relay's integral sensor.
Ambient light + controlled light level as measured by the light dependent relay's integral sensor.

## Notes

1. It is good practice to try to achieve a correct installation where the light emitted from the lamp(s) does not influence the light level seen by the sensor, although the "light feedback compensation" principle will help when this is not fully achievable. In this case it should be appreciated that the "light feedback compensation" principle may delay slightly the time of Switch Off - beyond the ideal.
2. The compensation principle is not effective where the combined effect of the ambient light and the controlled lighting exceeds 120 lux.
3. The 10.32 and 10.41 types are compatible with gas discharge lamps that attain full output within 10 minutes, since the electronic circuit monitors lamps' light output over a 10 minutes period to achieve a true assessment of its contribution to the overall lighting level.

Energy saving in a new light!
11 Series. Light dependent relays 12-16 A

- Innovative Finder patent simplifies installation
- Totally Cadmium free (contacts and photosensor)
- Double insulation between supply and light sensor

- Non polarized
- Double insulated with respect to light dependent relay supply

## 11 Series - Light Dependent Relay

## Advantage of the "light feedback compensation" principle (Italian Patent)

 avoids the effect of the lamps repeatedly "hunting" between On and Off, due to poor installationLight dependent relay where the lighting being controlled does not influence the light level seen by the light sensor

Traditional light dependent relay where the lighting being controlled influences the light level seen by the light sensor

Type 11.41 and 11.91 light dependent relay with "light feedback compensation"

Correct functioning - provided the light sensor can be shielded from the effects of the controlled lighting switching On and Off

Incorrect functioning where the lamps cycle between On and Off, because their effect is being detected by the light sensor

The innovative principle of "light feedback compensation" avoids the annoying and damaging effects of the lamps repeatedly
"hunting" between On and Off, due to poor installation

Ambient light level as measured by the light dependent relay's light sensor
Ambient light + controlled light level as measured by the light dependent relay's light sensor

## Notes

1. It is good practice to try to achieve a correct installation where the light emitted from the lamp(s) does not influence the light level seen by the light sensor, although the "light feedback compensation" principle will help when this is not fully achievable. In this case it should be appreciated that the "light feedback compensation" principle may delay slightly the time of Switch Off - beyond the ideal.
2. The compensation principle is not effective where the combined effect of the ambient light and the controlled lighting exceeds a maximum value (200 lux for the 11.91, 160/2,000 lux for standard/high range of the 11.41).
3. The 11.41 and 11.91 types are compatible with gas discharge lamps that attain full output within 10 minutes, since the electronic circuit monitors lamps' light output over a 10 minute period to achieve a true assessment of its contribution to the overall lighting level.

11 Series - Light Dependent Relay

## Type 11.91 "Versatile"

Light dependent relay + time switch
Auxiliary output (light only dependent) to power optional 19.91 power module Italian patent "Light feedback compensation" principle

- 1 CO (16 A 250 V AC) + 1 aux output
- Supply voltage: 230 V AC
- 35 mm rail (EN 60715) mount

## Accessories

Light sensor Type 011.02

Type 27.01 - page 82
Type 27.21 - page 84

Different types of stepping relay can be used within the same system. Just observe the appropriate wiring for the Push buttons and Loads.

## 15 Series - Electronic step relay and Dimmer

If the lighting load comprises low voltage halogen lamps fed through either electromagnetic or electronic transformers, then do not connect more than one transformer per 15.51 dimmer.

## C $\in$ © ( 1 )

## Type 15.51

- Power max.: 400 W 230 V AC
- Supply voltage: AC
- Panel mount

Wiring diagram-3 wire

## Operating mode setup:

On 15.51 operating mode 1 is preset, but it is possible to change it using the following sequence:
a) remove the supply voltage;
b) press the control button;
c) apply the supply to the relay, keeping the button closed for 3 second;
d) On button release, the light will flash twice to indicate the selection of operating mode 2 , or flash once for operating mode 1 .
Repeating the above steps will alternately change between operating modes.

## 15 Series - Electronic step relay and Dimmer

Functions (Type 15.51.8.230.0400)
Operating mode 1 (with memory): the previous light level is memorized.

Long control pulse: The light level is progressively raised or lowered through a maximum of 10 incremental steps.

Short control pulse: Alternately switches between On and Off. When switching On, the light level assumes the value set during the previous On state.

Operating mode 2 (without memory): on switch off, the light level is not memorized.

Long control pulse: The light level is progressively raised or lowered through a maximum of 10 incremental steps.

Short control pulse: Alternately switches On or Off between the maximum light level and the off state.

## Functions (Type 15.51.8.230.0404)

Operating mode 3 (with memory): the previous light level is memorized.

Long control pulse: The light level is progressively raised or lowered.

Short control pulse: Alternately switches between On and Off. When switching On, the light level assumes the value set during the previous On state.

Operating mode 4 (without memory): on switch off, the light level is not memorized.

Long control pulse: The light level is progressively raised or Lowered.

Short control pulse: Alternately switches On or Off between the maximum light level and the off state.

## 15 Series - Electronic step relay and Dimmer

- 35 mm rail (EN 60715) mount

## C © © (B)

Wiring diagram-4 wire

## (1) finder

## 15 Series - Electronic step relay and Dimmer

Operating mode without memory: at switch-off, the light level is not memorized.
Long control pulse: The light level is progressively raised or lowered in linear way. The lowest value depend on the "minimum dimming level" regulator setting.
Short control pulse: Alternately switches between On and Off between the maximum light level and the off state.

Operating mode with memory: the previous light level is memorized.
Long control pulse: The light level is progressively raised or lowered in linear way. The lowest value dependent on the "minimum dimming level" regulator setting.
Short control pulse: Alternately switches between On and Off. When switching On, the light level assumes the value set during the previous On state.

| Type of load | Selector setting |  | Regulator setting |
| :---: | :---: | :---: | :---: |
|  | With memory (M) | Without memory (M) |  |
| - Incandescent lamps <br> - 230 V halogen lamps <br> - $12 / 24 \mathrm{~V}$ halogen lamps with electronic transformer/ballast |  |  | It is suggested to set the "minimum dimming level" at the lowest value, so that the complete dimming range is available. But if it is necessary to avoid too low a level of illumination, a higher value can be set. |
| - Dimmable compact fluorescent lamps (CFL) <br> - Dimmable LED lamps |  |  | It is suggested to initially set the "minimum dimming level" at an intermediate value and then if necessary, readjust for a level found to be compatible with the lamp being used. - + |
| - 12/24 V halogen lamps with toroidal or E-core electromagnetic transformer |  |  | It is suggested to set the "minimum dimming level" at the lowest value, so that the complete dimming range is available. But if it is necessary to avoid too low a level of illumination, a higher value can be set. |

## 15 Series - Electronic step relay and Dimmer

## Type 15.91

- Power max.: 100 W 230 V AC
- Supply voltage: 230 V AC
- For mounting within residential switch boxes

C $\epsilon$

## 15 Series - Electronic step relay and Dimmer

Operating mode sełup
On 15.91 operating mode 4 (without memory) is preset, but it is possible to change it using the following sequence:
a) remove the supply voltage;
b) press the control button;
c) apply the supply to the relay, keeping the button closed for 3 second;
d) on button release, the light will flash twice to indicate the selection of operating mode 3, or flash once for operating mode 4. Repeating the above steps will alternately change between operating modes.

## Functions (type 15.91.8.230.0000)

Operating mode 3 (with memory): the previous light level is memorized.

Long control pulse: The light level is progressively raised or lowered.

Short control pulse: Alternately switches between On and Off. When switching On, the light level assumes the value set during the previous On state.

Operating mode 4 (without memory): on switch off, the light level is not memorized.

Long control pulse: The light level is progressively raised or Lowered.

Short control pulse: Alternately switches On or Off between the maximum light level and the off state.

18 Series - PIR movement detector

Type 18.01
Internal installations
Protection category IP 40

Type 18.11
External installations
Protection category IP 54

- 1 NO, 10 A 230 V AC
- Supply voltage: AC

For wall mounting

## C $\in$ (B) (c)

The output relay will remain On for the pre-set time, following the last detection of movement.

## 18 Series - PlR movement detector

Mounting and orientation

Type 7P.02.8.260.1025-SPD Type 1+2

## For single phase system.

Varistor + GDT protection L-N + GDT protection N-PE.

- Visual fault and remote contact fault signalling varistor/GDT status, N-PE GDT presence
- Upside down mounting possible
- Replaceable modules
- Possibility of serial connection (V-shape)
- 35 mm rail (EN 60715) mount

T-single phase system - SPD up-stream of RCD

## 7P Series - Surge Protection Device

Type 7P.03.8.260.1025-SPD Type 1+2
For three phase system without Neutral (PEN conductor).
Varistor + GDT protection L1, L2, L3-PEN.

- Visual fault and remote contact
fault signalling varistor/GDT status
- Upside down mounting position
- Replaceable modules
- Possibility of serial connection (V-shape)
- 35 mm rail (EN 60715) mount

## C $\in$ B

TN-C- three phase system - SPD up-stream of RCD

TT-three phase system - SPD up-stream of RCD
Wiring diagrams "V-shape" (fuse max = 125 A )

## Serie 7P - Scaricatori di sovratensione

Type 7P.05.8.260.1025-SPD Type 1+2 For three phase system with Neutral. Varistor + GDT protection L1, L2, L3-N + varistor + GDT protection N-PE.

- Visual fault and remote contact fault signalling varistor/GDT status
- Upside down mounting position
- Replaceable modules
- Possibility of serial connection (V-shape)
- Montaggio su barra 35 mm (EN 60715)

## C $\in$

T - TN-S- three phase system - SPD up-stream of RCD

## 7P Series - Surge Protection Device

## Type 7P.21.8.275.1020-SPD Type 2

Varistor protection L/N ( $\underset{\cong}{\perp})-\underset{\cong}{\perp}(\mathrm{L} / \mathrm{N})$

- Surge arrester suitable for 230 V system/applications
- Single phase systems
- Replaceable varistor module
- Visual and remote signalling of varistor status
- 35 mm rail (EN 60715) mount

Note: suggested RCD type $S$

## 7P Series - Surge Protection Device

- Suitable for 230 V system/applications
- Single phase systems
- Visual indication of varistor status Healthy/Replace
- Replaceable modules
- Visual and remote signalling of varistor status
- 35 mm rail (EN 60715) mount

## 7P Series - Surge Protection Device

## Type 7P.32.8.275.2003

## SPD Type 3

Provides easy additional surge protection
for existing 230 V sockets

- Protects electric and electronic equipment against pulse overvoltage (example: TV, Hi-Fi, PC ...)
- Acoustical (buzzing) signalling of varistor fault
- Combined varistor + spark-gap protection
(avoiding earth leakage current)
- Small size
- For incorporation within socket outlets

## CE 厄

TT or TN-S single phase system incorporated in socket outlet

[^3]
## 7P Series - Surge Protection Device

## Type 7P.37.8.275.1003-SPD Type 3 - For TT and TN-S system (with Neutral)

- L-N/N-PE protection
- Permits serial connection for optimized load protection up to 16 A
- Remote signaling of varistor status by integral change-over relay contact
- 35 mm rail (EN 60715) mount
$\Pi$ or TN-S single phase system SPD down-stream of RCD - Serial connection

## Accessories for level control relays 72 Series

Type 072.01.06 - Cable length: $6 \mathrm{~m}\left(1.5 \mathrm{~mm}^{2}\right)$
Type 072.01.15-Cable length: $15 \mathrm{~m}\left(1.5 \mathrm{~mm}^{2}\right)$
Suspended electrode for conductive liquids, complete with cable.
Suitable for level monitoring in wells and reservoirs not under pressure. All materials used are compatible with food processing applications.

Tipo 072.31
Suspended electrode

Type 072.02.06
Cable length (blue colour): $6 \mathrm{~m}\left(1.5 \mathrm{~mm}^{2}\right.$ )
Electrode for swimming pools with
high levels of chlorine, or in salt-water pools with high levels of salinity.

Type 072.11 - Floor water sensor, designed for the detection and reporting of the presence of floor surface water.

Type 072.51 - Electrode holder with two pole connector, one connected directly to the electrode and the second connected to the grounded installation thread. Suitable for metal tank with $\mathrm{G} 3 / 8^{\prime \prime}$ linkage.

Type 072.53
Electrode holder with three poles

Type 072.500
Type 072.501
Electrode.
500 mm long.

Level control relays for conductive liquids

Priority change relay
Type 72.42, Special relay for alternating loads, for applications with pumps, compressors, air conditioning or refrigeration units.

## Type 72.42 - Monitoring relays

## Type 72.42

- 2 independent NO output, 12 A 250 V AC
- Supply voltage: ( $110 \ldots 240$ ) V and $24 \mathrm{~V} \mathrm{AC} / D C$
- 35 mm rail (EN 60715) mount

## C $\in$

(MI) Outputs alternate on successive applications of supply voltage

- Application of the supply voltage to A1-A2 forces just one output contact to close, but the contact that closes will alternate between 11-14 and 21-24 on each successive application of the supply - ensuring even wear across both motors.
- The other output contact can be forced closed by the closure of either S1 or S2-but to limit high current surges the other motor cannot start within T seconds of the first motor.

## Type 72.42 - Monitoring relays

(ME) Outputs alternate according to control signal

- The supply voltage is permanently applied to A1-A2.

When closed, S1 forces just one output contact to close. The contact that closes will alternate between 11-14 and 21-24 on each successive S1 closure - ensuring even wear across both motors.

- If closed, S2 forces both output contacts to close (irrespective of S1). However, to limit high current surges, both motors cannot start within T seconds of each other.

(M2) Output 2 (21-24) only
- Supply permanently applied to A1-A2.
- Closure of either S1 or S2 will close output contact 2 (21-24). Use when load 1 (11-14) is out of service.

## Type 72.A1 - Float switch

## CE Type 72.A1

- Float switch with 2 watertight chambers, - 1 CO 20 A 250 V AC for plumbing pumps and grey water systems - Protection degree: IP 68
- Counterweight $(300 \mathrm{gr})$ with cable grip, included

When black and brown wires are used, the circuit opens when the float is down and closes when the float in up. In this case the blue/grey wire must be insulated.

Filling
function

When black and blue/grey wires are used, the circuit opens when the float is up and closes when the float in down.
In this case the brown wire must be insulated.

## Type 72.B1 - Float swith

## C

Type 72.B1

- Float switch with 3 watertight chambers, for dirty water systems, drainage plants and pumping stations
- Supplied with fixing kit

Emptying function

When black and brown wires are used, the circuit opens when the float is down and closes when the float in up. In this case the blue/grey wire must be insulated.

- 1 CO 20 A 250 V AC
- Protection degree: IP 68

When black and blue/grey wires are used, the circuit opens when the float is up and closes when the float in down.
In this case the brown wire must be insulated.

## 77 Series - Modular Solid State Relay

## 80 Series - Modular timers

## Type 80.01/11/21/61

- 1 CO, 16 A 250 V AC
- 1 CO, 8 A 250 V AC (80.61 only)
- Supply voltage: AC or DC
- 35 mm rail (EN 60715) mount

## C $\in$ © © 4 ©

## Functions

$\mathrm{U}=$ Supply voltage $\quad{ }^{-}=$Output contact

Type 80.01, 80.11

## (Al) On-delay

Apply power to timer. Output contacts transfer after preset time has elapsed. Reset occurs when power is removed.

Type 80.01, 80.21

## (DI) Interval

Apply power to timer. Output contacts transfer immediately. After the preset time has elapsed, contacts reset.

Type 80.01

## (SW) Symmetrical flasher (starting pulse on)

Apply power to timer. Output contacts transfer immediately and cycle between ON and OFF for as long as power is applied. The ratio is $1: 1$ (time on $=$ time off).

## (BI) Power off-delay (True off-delay)

Apply power to timer (minimum 300ms). Output contacts transfer immediately. Removal of power initiates the preset delay, after which time the output contacts reset.

## 80 Series - Modular timers

## Type 80.01/41/91

- 1 CO, 16 A 250 V AC
- Supply voltage: AC or DC
- 35 mm rail (EN 60715) mount

## 

## Functions

$U=$ Supply voltage $\quad S=$ External Start $\quad$ Output contact

Type 80.01, 80.41

## (CE) On- and off-delay with control signal

Power is permenently applied to the timer. Closing the Signal Switch (S) initiates the preset delay, after which time the output contacts transfer. Opening the Signal switch initiates the same preset delay, after which time the output contacts reset.

## (DE) Interval with control signal on

Power is permenently applied to the timer.
On momentary or maintained closure of Signal Switch ( $S$ ), the output contacts transfer, and remain so for the duration of the preset delay, after which they reset.

## (BE) Off-delay with control signal

Power is permenently applied to the timer. The output contacts transfer immediately on closure of the Signal Switch (S). Opening the Signal Switch initiates the preset delay, after which time the output contacts reset.

Type 80.91

## (LE) Asymmetrical flasher (starting pulse on) with control signal

Power is permenently applied to the timer.
Closing Signal Switch (S) causes the output contacts to transfer immediately and cycle between ON (T1) and OFF (T2), until opened.

## 80 Series - Modular timers (SST)

## Type 80.71

Multi-function \& Multi-voltage Solid State output timer

- 1 NO, 1 A (24...240)V AC/DC
- Supply voltage: AC or DC

35 mm rail (EN 60715) mount

## CEPG

Timing function initiated by the application of the supply voltage

Timing function initiated by start signal to terminal B1

## Functions

(Al) On-delay
Apply power to timer. Output contacts transfer after preset
time has elapsed. Reset occurs when power is removed.
(BE) Off-delay with control signal
Power is permenently applied to the timer. The output contacts transfer
immediately on closure of the Signal Switch (S). Opening the Signal Switch
initiates the preset delay, after which time the output contacts reset.

## 80 Series - Modular timers

## Type 80.91

Asymmetrical recycling timer - ON start

- 1 CO, 16 A 250 V AC
- Supply voltage: AC or DC
- 35 mm rail (EN 60715) mount

## C $\in$ © (1T) $\mathbb{C B}$

Timing function initiated by the application of supply voltage

Functions
$\underline{U}=$ Supply voltage $\quad$ - Output contact

(LI) Asymmetrical flasher (starting pulse on)

Apply power to timer. Output contacts transfer immediately and cycle between ON and OFF for as long as power is applied.
The ON ( $\mathrm{T}_{1}$ ) and OFF ( $\mathrm{T}_{2}$ ) times are independently adjustable.

## Type 80.82

## Star-Delta timer

- 2 NO, 6 A 250 V AC
- Supply voltage: AC or DC
.35 mm rail (EN 60715) mount

## ( $\in$ © © 1 us

Functions
$\mathrm{U}=$ Supply voltage

(SD) Star-delta
Apply power to timer. The star contact ( $\lambda$ ) closes immediately. After preset delay has elapsed the star contact ( $\lambda$ ) resets. After a further transfer time variable from ( $0.05 \ldots 1$ )s the delta contact ( $\Delta$ ) closes and remains in that position, until reset on power off.

Timing function initiated by the application of supply voltage

## 81 Series - Modular timers

## Type 81.01

Multi-function and multi-voltage timer

- 1 CO, 16 A 250 V AC
- Supply voltage: AC or DC
- 35 mm rail (EN 60715) mount

## C $\epsilon$

Wiring diagram
(Supply START)

Wiring diagram
(Signal START)

| Time range | (0.1...1) ${ }^{\text {s }}$ | (1...10)s | (10...60)s | (1...10)min | (10...60) min | (1...10) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| setting | 1 | 1 | 1 |  |  |  |
|  | 2 | 2 | 2 | 2 | 2 | 2 |

|  | 4 | 4 | $4 \square$ | $4 \square$ | $4 \square$ | 4 |
|  | 5 | 5 |  |  |  | 5 |
|  | 6 |  |  |  |  |  |

NOTE: time range and function must be set before energising the timer.

Supply START; ON delay function
Closing the external reset switch immediately resets the timer. Opening the reset switch re-initiates the timing function.

Signal START; ON pulse function.
Closing the external reset switch terminates the interval time and resets the timer. To re-start, it is necessary to open the reset switch, before closing the signal START contact.

## 81 Series - Modular timers

Application of the supply voltage initiates timing
Remote Start contact initiates timing

## 81 Series - Modular timers

## Functions

(Al) On-delay
Apply power to timer. Output contacts transfer after preset
time has elapsed. Reset occurs when power is removed.
(DI) Interval
Apply power to timer. Output contacts transfer immediately.
After the preset time has elapsed, contacts reset.
